# Loading a Gradle project into Eclipse & Building It.
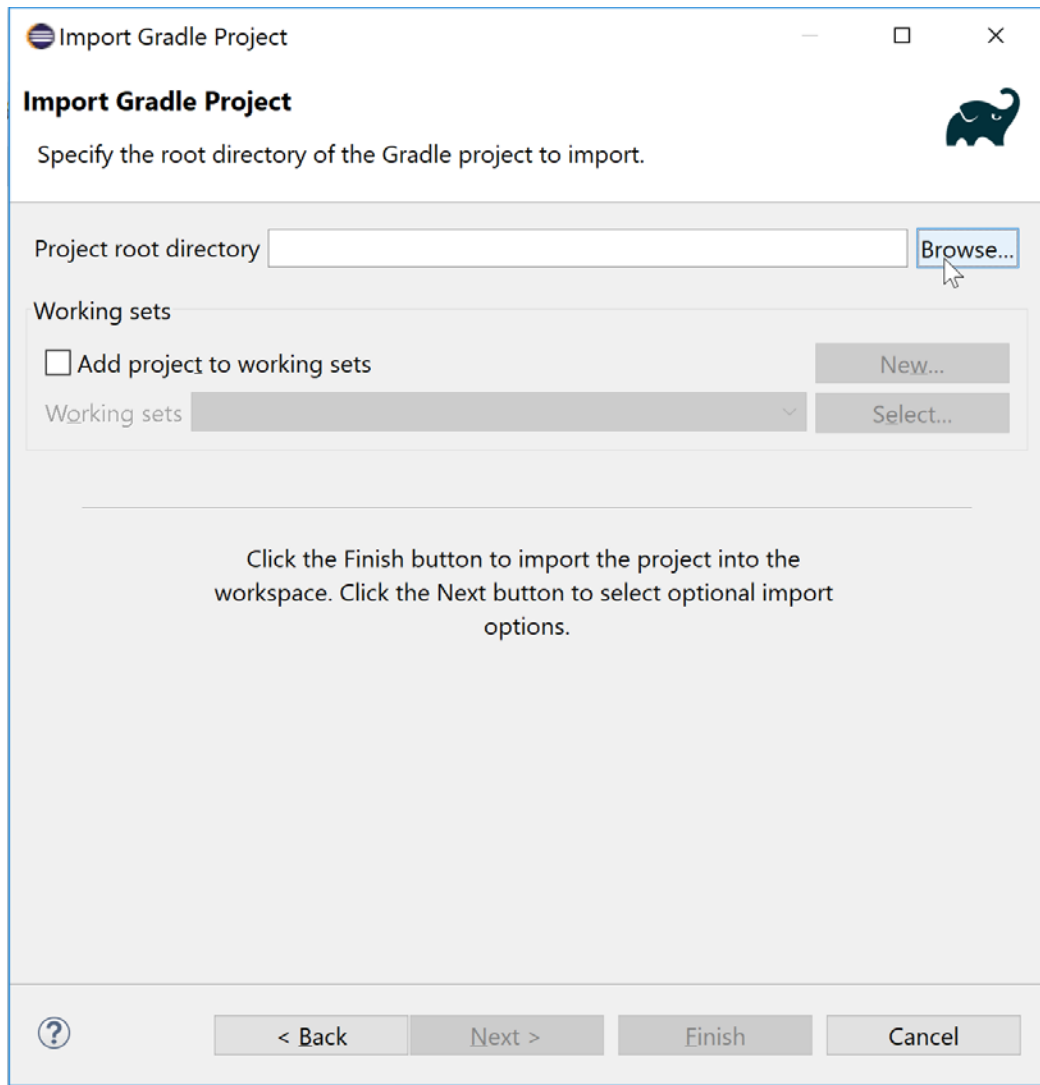

First, download and expand the .zip / .tgz file into a directory of your choice, then:

1. Load Eclipse
2. Choose "File | Import"
3. Choose "Gradle | Existing Gradle Project"

Hit "next" to go through the buildship welcome screen

Choose the location of the project:

Click "finish" to load the project.

This will load in the Eclipse project containing the gradle files. To run the tests, navigate to the Gradle Tasks pane and choose "build". This will compile the Java files and run the tests.

If you want to do things from the command line or from another IDE, you can use gradle directly starting from the build.gradle and settings.gradle file. To install gradle, follow the download and install directions from https://gradle.org/ that are appropriate for your platform. However, in this case you are on your own.
